# Flexi Cap Portfolio - Beta Management with 25% Shorting Option

A Flexi Cap long-short strategy with an objective of low volatility & lesser drawdowns that will benefit from an unconstrained flexi cap approach; constructing a market capitalization agnostic portfolio along with long & short option via extensive usage of derivative strategies within SEBI's prescribed regulatory limits.

The fund will employ a **Systematic Active Investing** approach designed for today's complex, data-saturated financial markets, where speed, scalability and structure are key to sustainable alpha generation.

Indicative* asset allocations, risk profiling & ranges			
Instruments	Risk Profile	Range %	
All cap cash equity / equity arbitrage	High / Low Risk	65 - 100	
All cap unhedged derivative strategies (Long)	High Risk	0 - 35	
All cap unhedged derivative strategies (Short)	High Risk	0 - 25	
Hedging	Moderate Risk	0 - 100	
Margins ( Cash, T-bills, G-secs )	Minimal Risk	0 - 15	

Minimum equity exposure (Long + Short) will be 80%

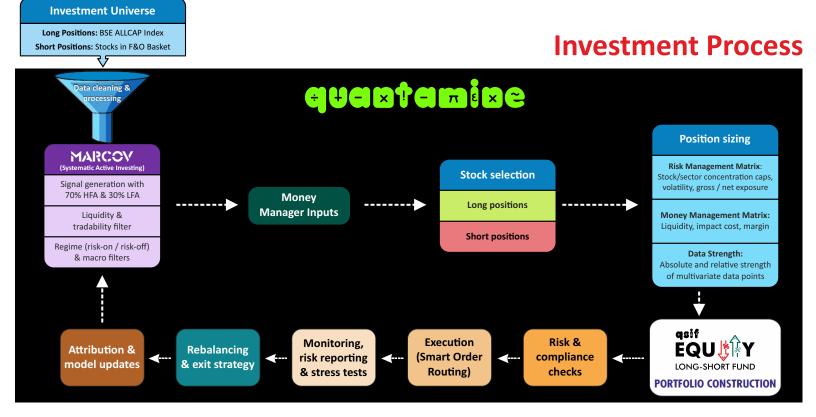

# **Tactical Longs, Opportunistic Shorts**

Tactical longs and opportunistic short positions along with robust risk management to generate alpha rather than a permanent allocation of long-shorts. This flexibility allows the fund manager to:

- Combine tactical longs with opportunistic shorts in Indian equities
- $\bullet \quad \text{Systematic Active Investing via our MARCOV investment framework to optimise long-short portfolios for asymmetric returns}\\$
- Hedge against market downturns
- Short overvalued securities within the existing F&O stocks
- Generate alpha during volatile periods
- Reduce portfolio beta during uncertain times
- Flexible long positions in large, mid, small cap segments
- Flexible short positions (up to 25%) across market caps
- Gross exposure can't exceed 100%, implies no leverage positions
- Controlled volatility and adaptive risk modulation
- Predominantly based on our High Frequency Analytics (HFA) to validate directional biases through a layered convergence model before capital is committed

# পু এর প্রামাণ প্রতিত্ব | Data Analytics & Risk Management Platform

quantamine is a fully integrated, in-house intelligence and execution architecture engineered for latency-sensitive multi-asset strategies. Designed as the central nervous system of the firm's investment operations, it unifies risk, compliance, investments, and operations into a frictionless, coordinated workflow. It ingests heterogeneous, high-dimensional datasets on macro-economy, microstructure, sentiment, liquidity, and volatility into a single actionable layer. Its architecture deploys advanced pattern recognition models to detect regime shifts, liquidity stress points, and market microstructure anomalies, dynamically recalibrating risk exposure in real time

<sup>\*</sup>Please refer ISID for standard asset allocations

# Introducing 'MARCOV'- Adaptive Precision

To implement the Systematic Active Investing with precision and depth, we have developed MARCOV, a proprietary investment framework that combines High Frequency Analytics (70%) and Low Frequency Analytics (30%).

Microstructure Analytics: Provides a high-resolution view of capital flows by analysing order book depth, liquidity conditions, volatility surfaces, term structures and impact costs. This helps us detect short-term imbalances, refine timing, and reduce overall cost, making it essential for both signal generation and trade execution.

Alternate Data Analytics: Expands our information edge by integrating non-traditional datasets such as web search trends, mobility flows, public registries, trade statistics, and geospatial/environmental feeds. These inputs help capture early indicators of behavioural shifts, supply—demand changes, and capital allocation patterns that conventional financial data often misses.

**Risk Analytics:** Acts as the guardrail of the process by measuring exposures across credit, liquidity, currency, duration, and derivatives. Using tools like VaR, Greeks, and stress tests, it ensures that position sizing, leverage, and portfolio construction remain robust across market regimes and tail events.

Cycles Analytics: Places every decision in temporal context by mapping economic, market, business, and credit cycles. By identifying where we are in broader rhythms, it enables anticipatory positioning, helping portfolios align with turning points rather than reacting after the fact.

**Objectivity Analytics:** Maintains discipline by validating models, filtering noise, and mapping perception—reality gaps. It works to minimise the impact of behavioural and narrative biases, ensuring that conviction is consistently grounded in evidence and not distorted by market sentiment or storytelling.

**Volatility Analytics:** Provides the framework to adapt exposure dynamically; by identifying volatility regimes, clustering, and dispersion, it guides hedging, drawdown control, and opportunistic positioning, turning turbulence into a tool for both protection and alpha generation.

# **Investment Allocation - Dual-approval Mechanism**

- We fuse machine intelligence from the 'quantamine' platform with human expertise to embed narrative depth and risk discipline into every allocation decision
- Predominantly based on our High Frequency Analytics (HFA), MARCOV validates directional biases through a layered convergence model before capital is committed
- The result is an integrated, forward-looking positioning model that can systematically pivot between offensive and defensive stances, ensuring that capital is consistently aligned with the prevailing and emerging market regime

# Long/Short Strategy - Proven Tool for Managing Volatility and Capturing Asymmetric Returns

### **Risk Management**

- The short positions can potentially offset some losses during market downturns, reducing overall portfolio volatility
- When long positions decline, profitable shorts can cushion the impact
- Less dependent on bull markets for returns

# Return

- Ability to generate returns from overvalued securities or sectors in decline
- Can potentially generate returns in sideways or volatile markets
- Short positions based on fundamental analysis can add value beyond market beta

# **Flexibility**

- 25% short allocation to express negative views on market caps, sectors or securities
- Ability to go fully long (potentially up to 100%) during extreme bull markets
- Can adjust the short book based on market conditions and opportunities

# No Leverage

- Eliminates risk of margin calls and forced liquidations
- No borrowing costs or margin interest
- Less stress from potential leverage-induced losses
